                                                                                                                                        CC treatment (MDDT) polypeptide (I) selected from a polypeptide having a CC sequence selected from 254 sequences (ABBP51231-ABP51484) given in the CC sequence selected from 254 sequences (ABBP51231-ABP51484) given in the CC sequence selected from 254 sequences (ABBP51231-ABP51484) given in the CC sequence selected from 254 sequences (ABBP51231-ABP51484) given in the CC sequence state of (I). (I) is useful for screening a compound for CC immunogenic fragment of (I). (I) is useful for screening a compound that CC specifically binds (I) or modulates the activity of (I), and for CC screening a compound for effectiveness in altering expression of a target CC polynucleotide comprising. Oligonucleotides and antibody by hybridoma technology. CC Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I) are useful for CC detecting MDDT in a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the CC expression of MDDT in a bindogical sample, for detecting (I) in a sample, caspociated with decreased or increased expression of functional MDDT. CC associated with decreased or increased expression of functional MDDT. CC associated with aberrant expression of MDDT. The manual of the model haver the disorders are selected from a cell proliferative disorder such as arteriosclerosis, callergy, anamala, asthma, atherosclerosis, gout, multiple sclerosis or condition companies and cancer and an antible schemals, asthma, atherosclerosis, sout, multiple sclerosis or condition componies or transgenic animals to model human diseases, in sommatic or componies conductions of a targenic animals to model human diseases, in sommatic or componies or conditions of a targenic animals to model human diseases, in sommatic or condition or conditions of a targenic animals to model human diseases.

Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders arteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g.

Claim Page 414; 618pp; English.

immunogenic fragment of (I). (I) is useful for screening a compound fo effectiveness as an agonist or antagonist, for screening a compound th specifically binds (I) or modulates the activity of (I), and for preparing a polyclonal or monoclonal antibody by hybridoma technology. Nucleic acids (II) (ABQ72449 ABQ72700) encoding (I) are useful for screening a compound for effectiveness in altering expression of a tar treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 254 sequences (ABP51231-ABP51484) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (I) or a biologically active or The invention relates to an isolated human disease detection target for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    detecting MDDT in a sample or for assessing toxicity of a test compound.

CC in a diagnostic test for a condition or a disease associated with the 
CC expression of MDDT in a biological sample, for detecting (I) in a sample, 
CC and for purifying (I) from a sample. A composition comprising (I), an 
CC agonist or antagonist is useful for treating a disease or condition 
CC associated with decreased or increased expression of functional MDDT.

CC (I) or (II) are useful for diagnosing, treating or preventing disorders 
CC associated with aberrant expression of MDDT, where the disorders are 
CC selected from a cell proliferative disorder such as arteriosclerosis, 
CC cirrhosis, hepatitis, psoriasis, and cancer and an 
CC autoimmune/inflammatory disorder such as AIDS, Addison's disease, 
CC allergy, anaemia, asthma, attherosclerosis, gout, multiple sclerosis or 
CC armelian for transgenic animals to model human diseases, in somatic or 
CC armelian for transgenic animals to model human field.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

CC method of the invention utilises a pair of oligonucleotide primers
CC comprising a nucleotide sequence that is complementary to a nucleotide
CC sequence of the target nucleic acid or complementary to a nucleotide
CC sequence of the complement of the target nucleic acid and further
CC comprising part of an interrupted restriction endonuclease recognition
CC sequence (RERS). The invention is useful for identifying a nucleotide at
CC a defined position in a single-stranded target nucleic acid. The defined
CC position may be polymorphic or associated with a disease, especially a
CC human genetic disease, or drug resistance of a pathogenic microorganism.
CC The defined position is associated with a disease, including a human
CC genetic disease e.g. bladder carcinoma, sickle-cell anaemia, or
CC wilson's disease, diabetes insipidus, familial hypercholesterolaemia, or
CC wilson's disease, diabetes insipidus, familial hypercholesterolaemia, or
CC for hereditary disease, tumour diagnosis, disease predisposition,
CC for hereditary disease, including a human and/or cell function and/or disease marker genes, and
CC cause infectious disease in plants or animals and/or that are related to food safety. The method is useful for determining gene variations in
CC are involved in the recognition of variable, antigen-specific regions that
CC are involved in the recognition of variable antigen-specific regions that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            21-JUN-2001;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method for analysing a variation site in a target polynucleotide. The method comprises contacting the target polynucleotide with multiple copies of a primer hybridising adjacent to, but not including, the variation site in the presence of a mixture of labelled and unlabelled forms of a nucleotide under conditions such that a copy of the primer is extended by incorporation of a labelled nucleotide complementary to a base occupying the variation site in the target polynucleotide; detecting the labelled nucleotide incorporated into the primer as an indication of the variation site base. The methods are useful for analysing variant sites in nucleic acids of interest, including point mutations and single nucleotide polymorphisms (SNP), and for detecting pathogens, paternity disputes, prenatal testing and forensic analysis. This polynucleotide sequence represents the DNA of an amplifier containing the CYP450.2D6.G1749C SNP relating to the

                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The inventice useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a protein fragment of cytochrome P450IId6 which is recognised by AIH Type IIa/IIb LKM1 antibody. The antigens and their complementing antibodies are used in the detection of auto-immuno-hepatitis type II and hepatitis C.
                                                                                                                                                                                                                 Claim 1;

                                                                                                                                                  expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, and the cartest that can be used to monitor disease states.
                                                                                                      drug toxicity, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                The invention relates to a novel method for diagnosing and detecting to progression of liver cancer, hepatocellular carcinoma or metastatic liver cancer from tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of the progression of the carcinoma in a patient.
                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in liver tissue sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gene; liver cancer; ds; hepatocellular carcinoma; hepatotropic; metastatic liver tumour; cytostatic; expression profile; disease state; disease progression; drug toxicity; drug efficacy; drug metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from

                                                                                            Matches
                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                labelled probe to the target sequence amplification product and a second labelled probe to the standard sequence amplification product, second labelled probe to the standard sequence amplification product, detecting the signals from the first and the second probe, and comparing the signals to determine the polymorphism. The method is useful for detecting polymorphism in various nucleic acid sequences e.g. CYF2D6 gene which is a member of cytochrome p430 (CYP) gene family. CYP2D6 plays a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a mutation in target nucleic acid sequence in test sample, amplifying target and standard nucleic acid sequence using primers, hybridizing probes to the products to form hybrids, and detecting
                                                                                                                                                                                                                                                                                      role in the metabolism of several drugs, including those used for treating psychiatric and cardiovascular disorders. Polymorphism in the CYP2D6 gene have varying effect on an individual's ability to metabolise drugs. The method is suitable for detecting amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid sequence using amplification technique. The method involves amplifying the target sequence and a standard nucleic acid sequence using primers to form amplification products, hybridising a first labelled probe to the target sequence amplification product and a
                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                           products from multiple and different types of polymorphisms on a single automated platform. The present sequence is human CYP2D6 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 1; Page 30; 35pp; English

                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                       The nucleotide sequence of the cDNA coding region for the human CC auxillary cytochrome P450 species 266. The gene encodes a protein of 497 CC amino acids. The cDNA was amplified by PCR using the primers AAQ87763-6. CC The product was cloned into the yeast expression vectors PAHSN or PAHRR CC to produce the vectors P2D6 for the expression of the cytochrome P450 celuctase. CC The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced CC human cytochrome P450 molecular species 1A2 (AAQ87714), 2C9 (AAQ87715), or 3A4 (AAQ87717) or their auxillary species and CC variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused CC rotein or in cell extracts, and analysing the resulting metabolite to determining whether the chemical compound. The method is useful for CC converted into a carcinogenic or mutagenic form through metabolism in the

The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly CC produced human cytochrome P450 molecular species 1A2 (AAQ87714), 2C9 CC (AAQ87715), 2E1 (AAQ87716-32), and yeast NADPH-P450 or their auxillary species and variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a CC fused protein or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for CC determining whether the chemical compound. The method is useful for CC converted into a carcinogenic or mutagenic form through metabolism in the CC liver.

The gene contains a change at base 886 from T to C as compared to the wild type sequence (AAQ87729). This changes the amino acid residue 296 from Cys to Arg. cDNA was amplified by PCR using the primers AAQ87763-6. The product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Evaluation of safety of a chemical cpd. - using recombinant yeast expressing human cytochrome p450 and a yeast NADPH-P450 reductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 1995-116991/16

The gene contains at bases 886: T to C and 1457: C to G as compared to the wild type sequence (AAQ87729). These change the amino acid residues 296: Cys C to Arg and 486: Thr to Ser. The cDNA was amplified by PCR using the C primers AAQ87763-6. The product was cloned into the yeast expression CC vectors pAADS or pAHRRR to produce the vectors p2D6 variant 2 for the C expression of the cytochrome P450 alone or p2D6R variant 2 for the C co-expression with the yeast NADPH-P450 reductase.

CC The vectors are used in a method for evaluating the safety of a chemical compound by reacting the chemical compound with recombinantly produced thuman cytochrome P450 molecular species 1A2 (AAQ87714), 2C9 (AAQ87715), C2E1 (AAQ87716), or 3A4 (AAQ87717) or their auxillary species and CC variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused CC variants (AAQ87718-32), and yeast NADPH-P450 reductase, either as a fused CC converted into a carcinogenic or mutagenic form through metabolite to cassess the safety of the chemical compound, or its metabolite, will be CC converted into a carcinogenic or mutagenic form through metabolism in the

RESULT 12
AAQ87732
The nucleotide sequence of the cDNA coding region for the human compound at lary cytochrome P450 species 2D6 variant 3. The gene contains a CC change at base 1457 from C to G as compared to the wild type sequence CC (AAQ87729). This changes the amino acid residue 296 from Thr to Ser. The CC change amplified by PCR using the primers AAQ87763-6. The product was compound into the yeast expression vectors pAAH5N or pAHRR to produce the cytochrome P450 alone CC or p2D66 variant 3 for the expression of the cytochrome P450 alone CC reductase. The vectors are used in a method for evaluating the safety of CC reductase. The vectors are used in a method for evaluating the safety of CC produced human cytochrome P450 molecular species 1A2 (AAQ87714), 2C9 CC (AAQ87715), 2E1 (AAQ87716), or 3A4 (AAQ87717) or their auxillary species and variants (AAQ87718), and yeast NADPH-P450 reductase, either as a CC fused protein or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining whether the chemical compound, or its metabolite, will be converted into a carcinogenic or mutagenic form through metabolism in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-JUL-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                   CC This is the nucleotide sequence of the human cytochrome P450 molecular CC species 2D6 variant #1 which encodes a protein of 497 amino acids. The CC gene was amplified from a human liver derived cDNA library as 2 CC fragments of 0.4 and 0.9 kb using primers AMT26933-6. The prod. was Cloned into the yeast expression vector pAAH5N to generate plasmid p2D6 CC for prodn. of the cytochrome only or into the vector pAHRR to generate CC the plasmid p2C6R for co-prodn. with the yeast NADPH-P450 reductase. The sequence is placed under control of the yeast ADH gene promoter and CC terminator. The vectors are used in a method for evaluating the safety of CC a cpd. by reacting the test cpd. with recombinantly produced human CC tytochrome P450 mol. species 1A2 (AAT28380), 2C9 (AAT28381), 2E1 CC (AAT28382), 3A4 (AAT28383) or their variants (AAT28384-98) together with cyest NADPH-P450 reductase (either as a fused protein or as a cell extract) and analysing the resultant metabolite. The cpd. is considered considered if it is detoxified or not rendered carcinogenic cpd. Sequence 1494 BP; 248 A; 508 C; 446 G; 292 T; 0 other;

                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                     This is the nucleotide sequence of the human cytochrome P450 molecular CC species 2D6 variant #2 which encodes a protein of 497 amino acids. The CC gene was amplified from a human liver derived CDNA library as 2 CC fragments of 0.4 and 0.9 kb using primers AAT26953-6. The prod. was CC cloned into the yeast expression vector PAAH5N to generate plasmid p2D6 CC for prodn. of the cytochrome only or into the vector pAHFN to generate CC sequence is placed under control of the yeast NADPH-P450 reductase. The CC sequence is placed under control of the yeast NADPH-P450 reductase. The CC cytochrome P450 mol. species 1A2 (AAT28380), 2C9 (AAT28381), 2E1 CC (AAT28382), 3A4 (AAT28383) or their variants (AAT28384-98) together with yeast NADPH-P450 reductase (either as a fused protein or as a cell cyeast NADPH-P450 reductase (either as a fused protein or as a cell cyeast NADPH-P450 reductase (either as a fused protein or as a cell cartact) and analysing the resultant metabolite. The cpd. is considered "safe" if it is detoxified or not rendered carcinogenic or "unsafe" if it is not detoxified or is metabolised to a carcinogenic cpd. Sequence 1494 BP; 248 A; 509 C; 446 G; 291 T; 0 other;
                                                                                                                                                                                                                                                                    Best
                                                                                                                                                                                                                                                                                    Query Match

CC species 2D6 variant #3 which encodes a protein of 497 amino acids. The cgene was amplified from a human liver derived cDNA library as 2 CC fragments of 0.4 and 0.9 kb using primers AAT26953-6. The prod. was CC cloned into the yeast expression vector pAAH5N to generate plasmid p2D6 CC for prodn. of the cytochrome only or into the vector pAHFR to generate CC the plasmid p2C6R for co-prodn. with the yeast NADPH-P450 reductase. The CC sequence is placed under control of the yeast NADPH-P450 reductase. The CC expl. by reacting the test cpd. with recombinantly produced human CC cytochrome P450 mol. species 1A2 (AAT28380), 2C9 (AAT28381), 2E1 CC (AAT28382), 3A4 (AAT283838) or their variants (AAT28384-98) together with cc yeast NADPH-P450 reductase (either as a fused protein or as a cell cextract) and analysing the resultant metabolite. The cpd. is considered crimer if it is detoxified or not rendered carcinogenic or "unsafe" if it is detoxified or rot rendered carcinogenic cpd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          17-JUN-1994;
